Acne

Causes and Practical Management

John Wiley & Sons **"Acne is a common ailment for teenagers but can persist well into middle age. Although the formation of comedones in hair follicles is quite well understood, the actual causes initiating the process are less well so. Many theories have been forwarded, from hormones through cleanliness to diet, none of which fully explain the condition. Indeed the variation in presentation and classification (there are three acnes) can make precise diagnosis troublesome. It is likely the causes are multifactorial, and evidence is accruing for all the above contributors. Many books have focused on the straightforward pathophysiological processes of hormones and cleanliness but have neglected the contribution of diet as a possible guide to prevention and other medical approaches to treatment. This book will take more catholic view, with a practical focus on all the possible modes of treatment based on current pathophysiological knowledge. The aim of the book is to assemble the pieces of the jigsaw puzzle so that the resulting picture will be comprehensible to physicians and other caregivers, and identify what is known and what needs more investigation"--Provided by publisher.**

Long-term Management of Distinct Facial Flushing and Persistent Erythema of Rosacea by Treatment with Carvedilol

Acne Rosacea

Rosacea is a common chronic inflammatory cutaneous disorder with variable presentation and severity. Disease usually occurs between the ages of 30 and 50 years. Women are more commonly affected than men. Rosacea is divided into four subtypes: erythematotelangiectatic, papulopustular, phymatous, and ocular, and one variant: lupoid or granulomatous rosacea. Erythematotelangiectatic rosacea is manifested as flushing and persistent centrofacial erythema, and papulopustular rosacea as papules and pustules in a centrofacial distribution. With disease progression, phymas consisting of sebaceous gland hypertrophy can develop. Ocular rosacea can result in blepharitis and conjunctivitis. Diagnosis is made clinically. Management of rosacea consists of protective measures such as sun protection and gentle skin care and topical and systemic treatments to suppress

Contact Urticaria Syndrome

Diagnosis and Management

Springer Contact urticaria is an immediate but transient localized swelling and redness that occurs on the skin after direct contact with an offending substance. It is caused by a variety of compounds, such as foods, preservatives, fragrances, plant and animal products, metals, and rubber latex and the mechanism by which these provoke an immediate urticarial rash at the area of contact can be divided into two categories: non-immunological contact urticaria and immunological (allergic) contact urticaria. Non-immunological contact urticaria typically causes mild localized reactions that clear within hours, e.g. stinging nettle rash. This type of urticaria occurs without prior exposure of a patient's immune system to an allergen. Immunological contact urticaria occurs most commonly in atopic individuals (people who are prone to allergy). Hence prior exposure to an allergen is required for this type of contact urticaria to occur. While there have been other texts written on the subject over the last decade, this book is intended as an easily accessible guide for dermatologists and residents, as well as general practitioners, summarizing the most important concepts that will help physicians identify the signs and symptoms of Contact Urticaria Syndrome in their daily clinical practice. Each chapter is laid out in the following format: Concepts, Tools and Algorithms of Diagnosis and Management, a Clinical Case for each entry, and Recommendations. Additionally, the Volume Editors have worked to provide a global approach to this syndrome using internationally standardized requirements for diagnosis.

Practical Management of Pediatric Ocular Disorders and Strabismus

A Case-based Approach

Springer This case-based approach to the management of pediatric eye diseases and strabismus teaches the novice, as well as the experienced surgeon, how to conceptualize and analyze surgical planning to maximize patient outcomes, allowing readers to "get inside the head of the surgeon." Individual cases with clear instructions and an abundance of color illustrations, presented by experts in the field, teach critical information one case at a time. Practical Management of Pediatric Ocular Disorders and Strabismus provides the key guiding principles of a traditional textbook in an easy-to-digest format. Each chapter of the text tackles a common or rare clinical situation and begins with the description of an illustrative case. The chapters are structured with sections on case description, differential diagnosis, management and outcomes with a list of possible complications and the approach to their management.

Ocular Rosacea

Acne rosacea (AR) is a chronic cutaneous inflammatory disease of the midface. Ocular involvement occurs in 30-70% of patients. Although the incidence of this disease is seen highest between the ages of 30 and 50 years, it can also develop during childhood. The diagnosis depends on clinical findings such as meibomian gland dysfunction (MGD), conjunctival hyperemia, and corneal vascularization, and untreated cases can progress and lead to vision loss. Pathogenetic factors can be the altered immune system, colonization of microorganisms, inflammation, abnormalities of sebaceous, and meibomian glands, environmental factors, and vascular dysregulation. Differential diagnosis from other ophthalmologic and dermatologic diseases is important. Management requires an interdisciplinary approach with a step-wise treatment algorithm. Patients should be informed about the chronic course of the disease and avoid the exacerbating factors. Caring about the lid hygiene and use of non-preserved artificial eye tears, topical ointments including antibiotics, anti-inflammatory agents are used when necessary. However, the mainstay of the therapy is the use of oral antibiotics for a long period. Surgical interventions may be needed in cases with a vision-threatening condition. During the long-term treatment period and disease course, the complications of medications should also be considered cautiously and patient should be followed up routinely.

Dermatology

Springer Science & Business Media DDDDDDDDDDD Effective management logically follows accurate diagnosis. Such logic often is difficult to apply in practice. Absolute diagnostic accuracy may not be possible, particularly in the field of primary care, when management has to be on analysis of symptoms and on knowledge of the individual patient and family. This series follows that on Problems in Practice which was concerned more with diagnosis in the widest sense and this series deals more definitively with general care and specific treatment of symptoms and diseases. Good management must include knowledge of the nature, course and outcome of the conditions, as well as prominent clinical features and assessment and investigations, but the emphasis is on what to do best for the patient. Family medical practitioners have particular difficulties and advantages in their work. Because they often work in professional isolation in the community and deal with relatively small numbers of near-normal patients their experience with the more serious and more rare conditions is restricted. They find it difficult to remain up-to-date with medical advances and even more difficult to decide on the suitability and application of new and relatively untried methods compared with those that are 'old' and well proven. vii Their advantages are that because of long-term continuous care for their patients they have come to know them and their families well and are able to become familiar with the more common and less serious diseases of their communities.

Absolute Dermatology Review

Mastering Clinical Conditions on the Dermatology Recertification Exam

Springer Each dermatologist that was board certified after 1992 is required by the American Board of Dermatology to take a recertification exam every ten years. One of the major components of the exam is to be able to identify clinical photographs of approximately 200 skin diseases, and while there are other components to the test, they vary according to subspecialty. However, everyone is required to identify the images, so several months before the exam, the American Board of Dermatology releases a list of the skin diseases that will be tested, but does not provide the images or reveal which ones will appear. Review of Clinical Conditions for the Dermatology Recertification Examination provides a thorough, concise review of clinical images of the specific conditions that the reader will be required to recognize during the American Board of Dermatology recertification test. In addition, concise key clinical features for each image will be provided that will assist the reader in recognizing the clinical images on the examination, enabling them a more efficient way to study for the test without having to look up images online or in a large text book. Written by a board certified dermatologic surgeon who recently took the recertification exam, this book proves indispensable to dermatologists taking the exam or residents who want a quick reference of the clinical appearances of the main conditions generally encountered by a dermatologist.
